AMENDMENTS TO THE CLAIMS

This listing of the claims replaces all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS

1. (Cancelled)
2. (Previously Presented) A method as claimed in claim 6, wherein calculating the at least one CDC comprises calculating a cyclic redundancy check (CRC).
3. (Previously Presented) A method as claimed in claim 6, wherein comparing comprises determining if the at least one associated record is changed[,] and yields information regarding the type of change, the information being input to the predefined algorithm.
4. (Previously Presented) A method as claimed in claim 3, wherein executing comprises effecting the registration by issuing a message to an electronic token reader in which the electronic token is docked, the message containing at least one parameter regarding the change for use by a registering element to which the message is sent by a token-resident applet via the electronic token reader.
5. (Previously Presented) A method as claimed in claim 4, wherein executing further comprises setting a response pending flag which is cleared if an acknowledgement of the message is received, wherein the flag is used to indicate that a message was not acknowledged.
6. (Currently Amended) A method for identifying changed records in a file on an electronic token, the method comprising:

- 3 -

Commissioner for Patents

Serial No. 09/987,828

calculating a change detection code (CDC) for ~~at least one~~each record of the file
and storing the respective CDCs in a memory of the electronic token;

comparing the calculated CDC with a stored CDC associated with the ~~at least one~~
record in order to determine if a change has been made to the ~~at least one~~
record since the stored CDC was calculated; and

if the calculated CDC is not equal to the stored CDC, executing the predefined
algorithm to effect registration of a change, save the calculated CDC as the
stored CDC and set one of a plurality of flags for the change depending on a
type of the change, so that different types of change can be differentiated.

7. (Previously Presented) A method as claimed in claim 5, wherein determining comprises using any flag set in association with the stored CDC, in conjunction with the values of the stored CDC and calculated CDC to determine if the record was changed since a last acknowledged message related to the record was sent.
8. (Previously Presented) A method as claimed in claim 4, wherein effecting the registration comprises sending the message to the registering element, which performs at least one of: synchronization of data across multiple data stores; update of a system with respect to the record; back-up of the record; and provision of a service feature in dependence on the change to the record.
9. (Previously Presented) A method as claimed in claim 8, wherein sending a message comprises issuing a short message service (SMS) message to a service provider that has access to the registering element.
10. (Previously Presented) A method as claimed in claim 9, wherein executing the predefined algorithm further comprises:
receiving information relating to the change;

Serial No. 09/987,828

formulating a notice of change (NOC) message; and

inserting as many NOC messages as possible into the SMS message before sending the SMS message.

11. **(Previously Presented)** A method as claimed in claim 10, wherein the electronic token is a subscriber identity module and comparing further comprises applying a comparison algorithm that executes on the subscriber identity module, the comparison algorithm being adapted to compare a CDC of each of a plurality of abbreviated dialing numbers (ADN) in the file; and the step of issuing comprises directing a SMS message to the registering element, which is adapted to perform at least one of the following: ensure conformity of the file with other versions of the file stored elsewhere; back-up the file; and, provide a service feature in dependence on the change.
12. **(Previously Presented)** A method as claimed in claim 8, wherein sending comprises formulating the message by inserting the at least one parameter into respective fields of the message, and forwarding the message to the registration element.
13. **(Previously Presented)** A method as claimed in claim 12, wherein formulating comprises inserting a record identifier, and information that specifies the change.
14. **(Previously Presented)** A method as claimed in claim 13, wherein formulating comprises inserting a value that indicates one of the following: the record was added; the record was deleted; and the record was modified.
15. **(Currently Amended)** An apparatus for providing a service to a subscriber having an electronic token, the apparatus comprising:

Serial No. 09/987,828

a change detection applet stored on the electronic token and adapted to be executed by a processor of the electronic token, the applet being adapted to identify any recordsrecord that ~~have~~has been changed since a change detection code (CDC) for the record was calculated and stored in a memory of the electronic token, by calculating a current CDC for ~~at least one of the recordsrecord~~, and comparing the current CDC with the stored CDC for the ~~at least one of the recordsrecord~~, and further adapted to send a notice of change (NOC) message to a registering element for registering detected changes.

16. (Original) An apparatus as claimed in claim 15, wherein the change detection applet calculates a cyclic redundancy check (CRC) to derive the current CDC.
17. (Original) An apparatus as claimed in claim 16, further comprising a registering element adapted to receive the NOC messages and use a content of NOC messages to perform at least one of the following: back up records for which the NOC message was generated; synchronize the file with other files remotely stored but commonly associated with a subscriber; and, provide a service dependent upon the detected change.
18. (Original) An apparatus as claimed in claim 15, wherein the electronic token is docked in a communications enabled device that comprises an electronic token reader adapted to exchange data in conformity with a predetermined protocol.
19. (Original) An apparatus as claimed in claim 18, wherein the electronic token comprises one of: a subscriber identity module (SIM) card compliant with a global system for mobile communications (GSM) standard; and a universal SIM (USIM) card.

20. (Original) An apparatus as claimed in claim 18, wherein the communications enabled device is adapted to function as a short message service (SMS) enabled telephone.
21. (Original) An apparatus as claimed in claim 15, further comprising a data store for storing a set of response pending flags that are associated with a list of records in the file, and the change detection applet is further adapted to use the set of response pending flags to determine if a record may have been changed since a last NOC message for the record was acknowledged.
22. (Original) An apparatus as claimed in claim 21, wherein the set of response pending flags comprises at least two flags used to encode change information, and the change detection applet is further adapted to use the plurality of flags, in conjunction with the stored CRC and current CRC, to determine if a notice of change message related to the record is to be sent.
23. (Currently Amended) A method applied by an electronic token for identifying changed records in a memory of the electronic token, the method comprising:
- calculating ~~at least one~~ change detection code (CDC) for ~~each record~~ each record of ~~the file in the memory and storing the respective CDCs in the memory of the electronic token;~~
 - comparing the calculated CDC with ~~a the~~ the stored CDC ~~stored in the memory in~~ order to determine if ~~at least one associated~~ the record has changed since the stored CDC was calculated; and
 - if the calculated CDC is not equal to the stored CDC, executing a predefined algorithm to effect registration of a change, and saving the calculated CDC as the stored CDC.
